

# Wikipedia's Credibility

## An Empirical Study on the Evaluation of the Online Encyclopedia

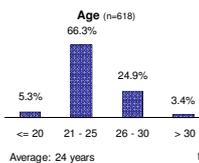

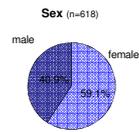

### Basics of the Study

- Background:**
- The Internet and wiki technology offer new opportunities of producing, gathering, and organizing knowledge.
  - Wikipedia is a free online encyclopedia whose basic principle implies that every user is allowed to add new articles and edit existing ones. Contents are not being checked by editorial staff, but by the users at large. Thus, participation by a great number of users shall ensure the contents' quantity as well as quality.
  - The original English version of Wikipedia was launched in 2001. Today there are Wikipedias in about 250 different languages with a total of 9.6 million articles. The second largest Wikipedia is the German one with approximately 700,000 articles ([http://meta.wikimedia.org/wiki/List\\_of\\_Wikipedias](http://meta.wikimedia.org/wiki/List_of_Wikipedias), 06.02.2009).
  - In Germany as well as worldwide, Wikipedia belongs to the top ten of the most frequently visited websites.
  - The use of Wikipedia as a source of knowledge seems to be popular among students. Apparently, they appreciate the benefits of freely available information on a broad range of subjects, although many universities disapprove of quoting Wikipedia in academic assignments as the online encyclopedia is not (yet) considered to be a reliable source of scientific information (Bendel 2006; Kuhlen 2005).
  - However, it is unknown how students themselves assess the online encyclopedia. Therefore, the primary research question of this study is:

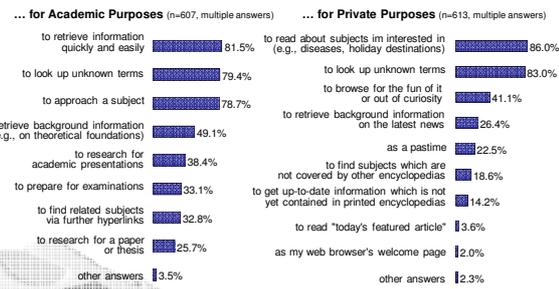

**How do students assess Wikipedia's credibility?**

- Methodology:**
- Online survey between 11 September, 2007 and 1 October, 2007
  - Target population: German-speaking students who use Wikipedia at least occasionally
  - Recruiting via mailing list of the University of Hohenheim and forwarding
  - Data cleaning left 618 data sets for analysis. On average, participants needed 14 minutes to complete the survey.

### General Results

#### Reasons to Use Wikipedia ...

#### Frequency of Wikipedia Use (n=618)

	for academic purposes	for private purposes	total
daily	5.5%	11.5%	64.6%
at least once a week	35.4%	41.6%	regularly
at least once a month	39.2%	33.2%	
less frequently	18.1%	13.3%	35.4%
never	1.8%	0.5%	rarely

### Specific Hypotheses and Results\*

#### Hypothesis 1: Students assess Wikipedia as less credible than other sources of information.

Research on the credibility of the Internet compared to other media has shown that many online resources are still seen rather sceptically. Online contents are considered as less trustworthy as they can be published and altered by any individual user (Flanagin/Metzger 2007; Ridder/Engel 2005; Schweiger 1999).

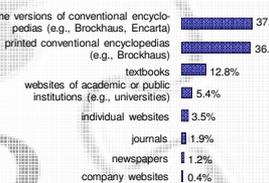

On a scale of 0 to 100 percent, what percentage of Wikipedia's information do you assume to be accurate and reliable? (n=558)

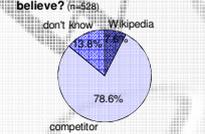

#### Ranking of Sources of Information According to their Perceived Credibility (n=592-595)

rank	source of information
1	textbooks
2	journals
3	conventional encyclopedias (printed or online)
4	websites of academic or public institutions
5	Wikipedia
6	newspapers
7	company websites
8	individual websites

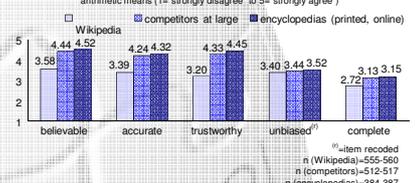

#### Wikipedia's Most Important Competitor (n=570)

If you got conflicting information from the following sources of information, which of the sources would you be more inclined to believe? (n=348)

#### Wikipedia's Perceived Credibility

To test this hypothesis, we used different operationalizations of credibility. The results are heterogeneous: Although the students assume a large percentage of Wikipedia's information to be reliable, they would prefer other sources of information if confronted with contradictory information. Furthermore, users rank Wikipedia as less credible than competing sources of information. This finding holds true for the ranking as well as the measurement via five items selected from former credibility research (Flanagin/Metzger 2007, 2000; Chesney 2006).

**Result: Hypothesis 1 can be accepted.**

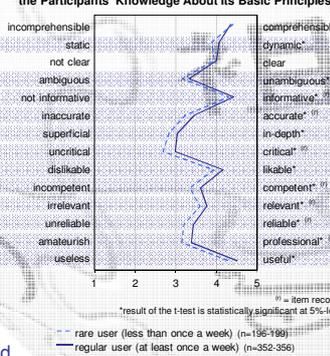

#### Hypothesis 2: The more frequently students use Wikipedia the more credible they assess the online encyclopedia.

Research on the credibility of traditional media and the Internet found a positive correlation between usage and perceived credibility of media (Flanagin/Metzger 2000; Schweiger 1999; Shaw 1973; Greenberg 1966; Westley/Severin 1964).

These results indicate that people either use those media they consider as credible or that they rate their most frequently used media as credible.

The present study confirms a positive correlation between the frequency of Wikipedia use and its perceived credibility. This finding applies to credibility ratings at large as well as to many single items used to measure the online encyclopedia's perceived credibility.

#### Wikipedia's Perceived Credibility According to the Participants' Knowledge About Its Basic Principles

**Result: Hypothesis 2 can be accepted.**

#### Hypothesis 3: Wikipedians assess Wikipedia as more credible than users who have never edited articles.

Users who have yet worked on Wikipedia contents by writing new articles or editing existing ones are termed Wikipedians.

They are assumed to be familiar with the basic principles of the online encyclopedia and to use it more intensively and actively than users who passively consume its contents.

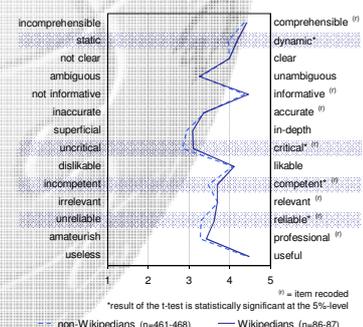

Therefore it is conceivable that Wikipedians' perceptions of the online encyclopedia might differ from those of other users.

#### Active Participation in Wikipedia (n=564)

	edited article	written article	total (Wikipedians)
yes	15.1%	3.5%	15.4%
no	84.9%	96.5%	84.6%

The data show that Wikipedians assess Wikipedia as more credible than passive users. Thus supports the hypothesis. However, many results are non-significant, which may be due to the small number of Wikipedians participating in this study.

#### Wikipedia's Perceived Credibility Among Wikipedians and Other Users

**Result: Hypothesis 3 can be accepted.**

#### Hypothesis 4: The more students know about Wikipedia's basic principles the more credible they assess the online encyclopedia.

Former credibility research found that the users' knowledge about and experience with a medium might influence their perception of that medium (Flanagin/Metzger 2007; Robinson/Kohut 1989).

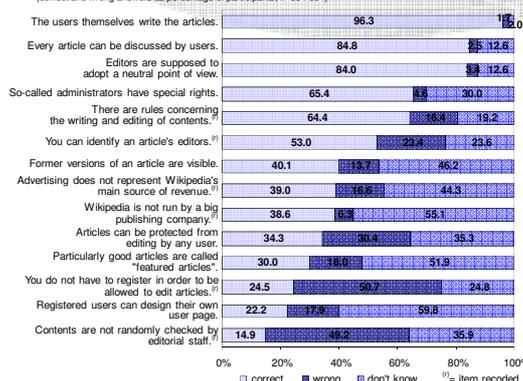

This might be true especially for Wikipedia which features distinctly new modes of gathering and publishing information. Awareness of the collaborative principle, i.e. that all contents are written and edited by other users without being controlled by editorial staff, is considered as an important factor in the perception of the online encyclopedia.

Additionally, this perception might be influenced by the users' knowledge about Wikipedia's organizational characteristics and its special features for providing a certain degree of content quality.

Knowledge about Wikipedia's basic principles is measured via several statements. Participants are classified according to their number of correct answers.

The assumed correlation between knowledge and perceived credibility is confirmed. Participants who are aware of most of Wikipedia's basic principles assess the online encyclopedia as significantly more credible than users with only very little knowledge. Students with a medium level of knowledge do not differ significantly from the other two groups for all items.

#### Knowledge About Wikipedia's Basic Principles (correct and wrong answers as percentage of participants, n=584-594)

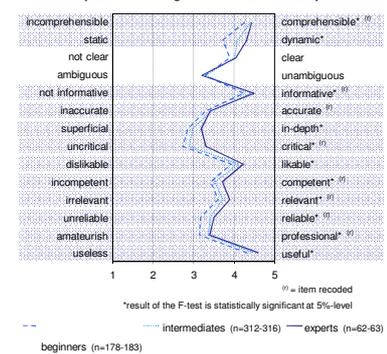

#### Classification of Participants According to their Knowledge About Wikipedia (n=573)

Classification according to the number of correct answers: beginners: 0-5 correct answers; intermediates: 6-10 correct answers; experts: 10-14 correct answers

arithmetic mean: 6.9 correct answers

#### Wikipedia's Perceived Credibility According to Participants' Knowledge About Its Basic Principles

**Result: Hypothesis 4 can be accepted.**
